2. Dawn of the Slinky<sup>®</sup>
3. Sound Stations
4. Resonance

# Lab: Just a Swingin'

November 13

- Obj: Experimentally determine whether the period of a pendulum is affected by its (1) length (2) mass or (3) initial energy
- Data: 5 equal intervals of each independent variable; measure the pendulum's time for 10 swings
- Calculations: Period from data. Show proof for one and record all results.
- Graphs: one for each independent variable
- Discussion

# LAB: THE SLINKY®

- Obj: (1) Determine the **period** , **frequency**, **wavelength** and **speed** of 4 different standing waves
- Safety notes: Keep Slinky® away from face, do not use in a moving vehicle, do not throw out a window...as a matter of fact don't throw it or any part of it...ever.
- Data: collect in sets of 10 waves, use table length as L, n = # of anti-nodes
- Calculations: show all equations and work for one standing wave
- Graph the relationship between frequency and wavelength
- Discussion

# Lab: Sound Stations

November 17

- Follow the provided lab procedures and complete on own paper
- [Click to download the lab procedures](#)

# Lab: Sound Resonance

November 28

- Obj: Experimentally determine wavelength and speed of sound waves produced by a resonating column of air
- Data: Resonance tube length for 3 different frequencies
- Calculations: Wavelength and speed. Show proof for one tuning fork and record all results.
- Graphs: wavelength v. frequency
- Discussion
